Blinded reaction-completion audit

Cases 1–20

Each case shows the incomplete input followed by two atom/charge-balanced completions in randomized order. One is from FlowER and the other from SynRBL; their identities are intentionally hidden.

Choose one assessment:

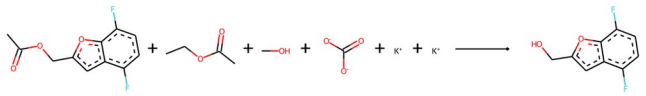

☐	**Equivalent**	Same chemistry; differences are acceptable protonation, salt, counterion, spectator, or representation choices.
☐	**A more plausible**	Not equivalent; completion A is chemically more reasonable.
☐	**B more plausible**	Not equivalent; completion B is chemically more reasonable.
☐	**Both plausible**	Not equivalent, but both are defensible completions.
☐	**Uncertain**	A reliable judgment cannot be made from the displayed information.

Also record high, medium, or low confidence and give a brief reason, especially when reagent consumption or byproduct identity differs.

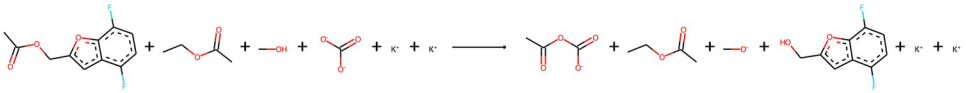

Please complete the audit before viewing the separate revealed-label key.
